

Elevate Operational Controls by Monitoring the Right Data Daily to Optimise Output and Reduce Losses

Qnum's Inventory Control Solution (Operational Intelligence Solution) helps manufacturers gain maximum return from investments made in their production systems by centralising production data generated from fragmented devices to provide real-time reporting.
ALL IN ONE PLACE.

This ability unlocks:

- Reducing time and manual effort required to report on production and performance.
- Monitor and analyse material consumption and production output rates to optimize overall equipment effectiveness.
- Access accurate stock levels daily to keep inventory procurement-related costs under control
- Reconcile all inventory transactions on a daily basis to avoid the month-end reporting challenges and elevate financial control

Below are some metrics that can be tracked closely on a daily basis to tighten controls:

1

Productivity

- Time spent on data handling
- # of data capture resources

2

Operational Efficiency Control

- Process waste (spillages, usage)
- Overall equipment effectiveness
- Energy cost management
- Production costs (cost per ton)

3

Inventory Cost Control

- Inventory carrying costs
- Raw material inventory costs
- Transportation costs

4

Finance and Risk Controls

- On-time monthly reporting
- Inventory variances (accounting discrepancies)
